### Report Overview:

A retimer is a digital and analog device. It receives the signal and extracts the digital part of it, then it regenerates it as a separately trained link, in both directions. Therefore, the noise (and other imperfections such as jitter), that was originally present, will be eliminated, it is like a fresh start from the re-generated signal.

A PCIe Retimer is usually implemented as an integrated circuit (IC) chip that can be used, when placed on a PCB, to extend the length of a PCIe bus. It is particularly used it has to pass through a connector to a cable or to another PCB and then to another PCB (i.e. mid-plane or back-plane layouts). The discontinuities caused by the interconnect, PCB/cable changes, etc. produce reflections and increase inter-symbol-interference. These signal challenges will cause the PCIe signal to be too poor at the end point to be received without errors (or a high risk of errors), without some active circuitry to work past those discontinuities. That active circuitry is the Retimer. It takes as inputs a PCIe signal and outputs a re-generated signal as if it were a fresh PCIe device, in both directions.

The Global PCIe Retimers Market Size was estimated at USD 147.32 million in 2023 and is projected to reach USD 1109.22 million by 2029, exhibiting a CAGR of 40.00% during the forecast period.
