Abstracts

These magnetic beads, typically composed of superparamagnetic iron oxide nanoparticles coated with a functional polymer such as carboxylated silica, are designed to selectively bind nucleic acids?specifically double-stranded DNA or RNA?in the presence of high concentrations of chaotropic salts and ethanol, allowing for rapid purification and concentration of PCR amplicons or enzymatic reaction products through magnetic separation, which eliminates the need for centrifugation, vacuum filtration, or organic extraction methods. Their mechanism relies on the surface chemistry that facilitates adsorption of DNA under optimized buffer conditions, followed by efficient washing to remove contaminants like primers, nucleotides, enzymes, salts, and other impurities, and finally elution in low-ionic-strength buffers or water to yield high-purity nucleic acids suitable for downstream applications such as sequencing, cloning, restriction digestion, or additional enzymatic modifications.

The global Pcr Clean Up Magnetic Beads market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
