Report Overview

Programmed death-ligand 1 (PD-L1) biomarker testing is a diagnostic method used to detect the expression of PD-L1 proteins on tumor cells or immune cells, primarily to identify patients who may benefit from immune checkpoint inhibitor therapies, such as anti-PD-1/PD-L1 drugs. This testing plays a crucial role in personalized oncology, as PD-L1 expression levels help predict treatment responsiveness in cancers like non-small cell lung cancer (NSCLC), melanoma, and bladder cancer. The test is typically performed via immunohistochemistry (IHC) on tumor tissue samples, with various FDA-approved companion diagnostic assays available, each with distinct scoring criteria. The growing adoption of immunotherapy has driven demand for PD-L1 testing, though challenges such as assay variability, tissue heterogeneity, and evolving clinical guidelines influence its standardization and clinical utility. The market is further shaped by advancements in multiplexed biomarker panels and next-generation sequencing, which aim to improve predictive accuracy beyond PD-L1 alone.

The global PD L1 Biomarker Testing market size was estimated at USD 3960.98 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 39.09% during the forecast period.
