### Report Overview:

PD-L1 Biomarker Testing measures the amount of PDL1 on cancer cells. PDL1 is a protein that helps keep immune cells from attacking nonharmful cells in the body. Normally, the immune system fights foreign substances like viruses and bacteria, and not your own healthy cells. Some cancer cells have high amounts of PDL1. This allows the cancer cells to "trick" the immune system, and avoid being attacked as foreign, harmful substances.

Current PD-L1 testing is based on immunohistochemistry (IHC) methods. Immunohistochemistry (IHC) is the process whereby antibodies are used to detect proteins (antigens) in cells within a tissue section (for instance liver, pancreas or the heart).

PD-L1 is a ligand that binds to PD-1 (programmed cell death-1), expressed on activated T cells, to evade anti-tumor responses. PD-L1 plays a role in inhibiting T cell activation and proliferation and has emerged as an important target in cancer treatment. PD-L1 protein detection by immunohistochemistry (IHC) testing is widely used as a predictive biomarker assay for anti-PD-1/PD-L1 therapies.

PDL1 testing is used to find out if you have a cancer that may benefit from immunotherapy.

The Global PD-L1 Biomarker Testing Market Size was estimated at USD 206.97 million in 2023 and is projected to reach USD 1473.59 million by 2029, exhibiting a CAGR of 38.70% during the forecast period.
