Abstracts

PDLC is an emerging electro-optical material made of a mixture of prepolymer and liquid crystal. Under specific exposure conditions, the polymer and liquid crystal will phase separate to form a film with specific optoelectronic properties. This film has an electrically controlled switching characteristic, that is, under the action of an external electric field, the arrangement state of the liquid crystal molecules will change, resulting in changes in the light transmittance of the film. The working principle of the reflective display is to use ambient light as a light source and illuminate the screen by reflecting light. This type of display usually does not have a backlight module, but reflects ambient light by installing reflective materials under the liquid crystal panel. Therefore, the display effect of the reflective display depends largely on the intensity of the ambient light.

The global PDLC Reflective Display market size was estimated at USD 55.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
