Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PE Release Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PE release film is a plastic film with a layer of release agent (usually silicone oil) on its surface to reduce the adhesion of the film surface, thereby achieving easy peeling characteristics. This film is often used in various industrial processes to prevent adhesion between materials and protect the product surface from contamination and damage. PE release film is very widely used in industrial applications due to its excellent chemical stability, good mechanical properties and easy processing. With the development of technology, PE release film is also constantly optimized and innovated to meet more diverse market needs. In 2024, global production is expected to reach approximately 145.6 million square meters, with an average market price of approximately US\$1.85 per square meter. Major companies in the industry will have gross profit margins ranging from 10% to 30%. The upstream segment of the PE release film industry chain primarily comprises PE base film, release agents (silicone oil), curing agents, and pressure-sensitive adhesives, with relatively stable technical barriers to entry. The midstream segment encompasses release film production and processing, including coating, curing, winding, and cleanliness control, which are crucial for determining product performance and quality. Downstream applications encompass a wide range of industries, including electronics, medical, and packaging. The prosperity and technological demands of these downstream sectors directly drive market demand for PE release film. PE release film offers excellent heat resistance, flexibility, dimensional stability, and surface smoothness, and is not susceptible to chemical reactions with adhesives. Compared to PET release film, PE has lower heat resistance and rigidity, but is softer and less expensive, making it suitable for applications where heat resistance is less critical, such

as protecting early-stage products and managing waste during manufacturing. The PE release film industry is currently experiencing steady expansion, driven by continued growth in the electronics manufacturing and medical sectors. While industry production capacity is concentrated in mid- and low-end products, demand in the high-end market is rapidly increasing. As downstream products evolve, release film companies must maintain sustained R&D investment to keep pace with technological advancements.

The global PE Release Film market size was estimated at USD 269.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
