## Abstracts

PECVD System for TOPCon refers to the Plasma-Enhanced Chemical Vapor Deposition (PECVD) equipment used in the production of Tunnel Oxide Passivated Contact (TOPCon) solar cells. TOPCon is a solar cell technology based on the principle of selective carrier transport and features a Tunnel Oxide Passivated Contact structure. It is built on an N-type silicon substrate. The concept of the TOPCon cell was first proposed in 2013 by the Fraunhofer Institute for Solar Energy Systems (Fraunhofer ISE) in Germany. In TOPCon cells, an ultra-thin silicon oxide layer (tunnel oxide) with a thickness of 1-2 nm is formed on the rear surface. Subsequently, a doped polysilicon thin layer of approximately 20 nm is deposited. Together, these two layers form a passivated contact structure that serves as the rear-side passivation layer for the cell. This structure effectively reduces surface and interface recombination, improves the open-circuit voltage (Voc), and provides greater potential for enhancing the cell's conversion efficiency.

The global PECVD System for Topcon market size was estimated at USD 2652.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.00% during the forecast period.
