Abstracts

A pediatric dosing platform is a specialized software or integrated digital health solution designed to ensure accurate, safe, and personalized medication dosing for pediatric patients, who require precise dosing adjustments based on weight, age, body surface area, and clinical condition. These platforms often integrate with electronic health records (EHRs), clinical decision support systems (CDSS), and pharmacy management tools to streamline prescribing, dispensing, and administration workflows while mitigating dosing errors, which are especially critical in pediatric care due to physiological vulnerabilities and the lack of standardized dosing for many medications. Such systems may also provide real-time alerts for potential overdoses, drug interactions, or renal/hepatic dosing adjustments, and often incorporate educational resources for healthcare providers, caregivers, and patients to improve adherence and understanding of complex medication regimens.

The global Pediatric Dosing Platform market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
