### Report Overview

Peg-modified drugs, also known as PEGylated drugs, are pharmaceuticals that have been chemically altered by attaching polyethylene glycol (PEG) chains to their structure. This modification enhances drug efficacy by prolonging circulation time in the bloodstream, reducing immunogenicity, and improving solubility and stability. PEGylation is widely used in biologics, such as proteins, peptides, and antibodies, to optimize therapeutic performance. Examples include PEGylated interferons for hepatitis C, PEGylated erythropoietin for anemia, and PEGylated enzymes for rare diseases. The market for PEGylated drugs is expanding due to their ability to enhance drug delivery, reduce dosing frequency, and minimize side effects, particularly in oncology, autoimmune disorders, and chronic diseases. Increased R&D investment, advancements in bioconjugation techniques, and growing demand for long-acting biologics are driving growth, though challenges like PEG immunogenicity and manufacturing complexity remain. The market is competitive, with key players focusing on novel PEGylation technologies and next-generation therapeutics.
