## Abstracts

Pegylated phospholipids are a class of synthetic lipids in which the hydrophilic head group is covalently linked to polyethylene glycol (PEG) chains, resulting in amphiphilic molecules that significantly enhance the stability, solubility, and circulation time of liposomal and nanoparticle drug delivery systems by reducing opsonization and clearance by the mononuclear phagocyte system. These modified lipids are critical components in the formulation of stealth liposomes and are widely utilized in pharmaceuticals to improve the therapeutic efficacy and bioavailability of encapsulated drugs, particularly in oncology for chemotherapeutic agents, as well as in vaccines, gene therapy, and diagnostic imaging.

The global Pegylated Phospholipids market size was estimated at USD 112.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
