Abstracts

Poly(ethylene glycol) (PEG) is a widely used polymer in drug delivery systems and is often directly conjugated to a drug therapeutic. PEG is a water-soluble, biologically inert, non-immunogenic synthetic polymer consisted of ethylene glycol (-CH₂-CH₂-O-) in repeating units. PEG is produced by anionic polymerization of ethylene oxide initiated by a nucleophilic attack of a methoxide ion on the epoxide ring. PEGylation of a protein conjugate is the process by which PEG is either non-covalently or covalently attached to a potential protein, peptide or antibody of interest to produce alterations in the physiochemical properties of the macromolecule in areas like conformation, electrostatic binding and hydrophobicity. PEGylation is used as a strategy to overcome challenges such as instability, inadequate circulation half-life and immunogenicity of a drug candidate intended for a therapeutic use.

The global PEGylation Proteins Technology market size was estimated at USD 2153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
