Abstracts

A Pelton hydro turbine runner is a critical component of a specific type of impulse turbine designed for high-head, low-flow water applications, where it converts the kinetic energy of a high-velocity water jet into mechanical rotational energy. It consists of a series of double-cupped buckets or vanes mounted symmetrically around the periphery of a wheel; as the pressurized jet of water strikes these buckets, it splits and reverses direction, transferring nearly all its momentum to the runner and causing it to spin. This design is highly efficient in harnessing energy from steep mountainous terrain or elevated water sources with significant vertical drop, making it particularly suitable for small to medium-scale hydroelectric power generation, as well as in certain industrial and mining operations where reliable mechanical or electrical power is derived from available high-head water resources.

The global Pelton Hydro Turbine Runner market size was estimated at USD 350.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
