Report Overview

The Gas Diffusion Layer (GDL) in a Proton Exchange Membrane (PEM) fuel cell is a crucial component that facilitates the flow of reactant gases (hydrogen and oxygen) to the catalyst layer, as well as the removal of reaction products and water from the cell. Materials commonly used for GDLs include carbon-based materials like carbon paper, carbon cloth, or carbon fiber paper. These materials possess the necessary porosity, electrical conductivity, and mechanical strength required for efficient operation in PEM fuel cells. Designing an optimal GDL involves balancing these properties to ensure high performance, durability, and cost-effectiveness in fuel cell applications. Researchers continually explore new materials and fabrication techniques to enhance GDL performance and advance PEM fuel cell technology.
