Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PEM Hydrogen Production Bipolar Plate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PEM hydrogen production bipolar plates are key components used in proton exchange membrane (PEM) water electrolyzers. They play an important role in distributing reactant gases (such as hydrogen and oxygen produced by water decomposition), conducting current, managing water distribution, and dissipating heat during the water electrolysis process. These bipolar plates typically require excellent electrical conductivity, corrosion resistance, and sufficient mechanical strength to ensure the efficiency and stability of the water electrolysis process. By optimizing the design and materials of the bipolar plates, the overall performance and durability of PEM water electrolyzers can be significantly improved, enabling a wider range of applications, such as energy storage, industrial hydrogen production, and hydrogen supply for fuel cell vehicles. In 2024, the global production of PEM hydrogen production bipolar plates will reach 3.98 million units, with an average selling price of US\$28 per unit.

The global PEM Hydrogen Production Bipolar Plate market size was estimated at USD 111.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 24.20% during the forecast period.
