Abstracts

Peptide drugs play a crucial role in the treatment of metabolic diseases, particularly in diabetes, obesity, and non-alcoholic fatty liver disease (NAFLD). These drugs often mimic or regulate endogenous hormones, such as glucagon-like peptide-1 (GLP-1), insulin, and glucagon, to improve blood sugar control, regulate appetite, and enhance lipid metabolism. In recent years, GLP-1 receptor agonists (e.g., semaglutide) and insulin analogs (e.g., insulin glargine) have been widely used in clinical practice, significantly improving treatment outcomes. Furthermore, innovative peptide drugs are being developed to enhance efficacy, prolong half-life, and reduce side effects, making them a promising direction for future metabolic disease therapies.

The global Peptide Drugs For Metabolic Diseases market size was estimated at USD 42500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.60% during the forecast period.
