Report Overview:

Peptide vaccines include one or more short or long amino acids sequences, as an antigen combined with a vaccine adjuvant. Thus they fall in the broad category of defined antigen vaccines, along with the vaccines using proteins, protein sub units, DNA and RNA. They remain the most immunogenic approaches based on the measures of T-cell responses. Peptide immunogenicity is influenced by the way in which peptides are presented to the immune system, underscoring the need for multifunctional delivery systems that couple antigen and adjuvant into a single construct.

The Global Peptide Vaccine Market Size was estimated at USD 3842.05 million in 2023 and is projected to reach USD 4946.17 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
