Report Overview

PERC technology improves conversion efficiency by adding a dielectric passivation layer on the backside of the cell. Better efficiency levels in standard cell structures are limited by the tendency of photogenerated electrons to recombine. PERC cells maximize the potential gradient across the P-N junction, which allows for more stable electron flow, reduced electron recombination, and higher efficiency levels. The biggest difference between PERC cells and conventional cells is the passivation of the dielectric film on the back surface and the use of localized metal contact, which greatly reduces the recombination speed of the surface and improves the light reflection on the back surface.

The global PERC Cells market size was estimated at USD 1528 million in 2023 and is projected to reach USD 3029.12 million by 2032, exhibiting a CAGR of 7.90% during the forecast period.

North America PERC Cells market size was estimated at USD 453.90 million in 2023, at a CAGR of 6.77% during the forecast period of 2024 through 2032.
