Abstracts

Percutaneous nephrolithotomy (PCNL) is a minimally invasive surgical procedure used to remove large or complex kidney stones that are not amenable to less invasive treatments such as shock wave lithotripsy or ureteroscopy. The procedure involves creating a small incision in the patient's back to access the kidney directly, after which a nephroscope is inserted to visualize and fragment stones using ultrasonic, laser, or mechanical energy, with the fragments then suctioned or grasped and removed. PCNL is particularly indicated for stones larger than 2 cm, staghorn calculi, stones in anatomically abnormal kidneys, or when other treatments have failed, offering higher stone-free rates for these complex cases compared to alternative modalities while minimizing tissue damage and promoting quicker recovery relative to open surgery.

The global Percutaneous Nephrolithotomy market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
