Abstracts

Perfluorinated Alkyl Acids (PFAAs) are a group of synthetic chemicals characterized by a fully fluorinated carbon chain of varying lengths and a hydrophilic functional group, such as carboxylic or sulfonic acid; these compounds are part of the broader family of per- and polyfluoroalkyl substances (PFAS), known for their extreme stability due to strong carbon-fluorine bonds, resistance to heat, water, and oil, which has led to their widespread historical use in industrial applications, consumer products like non-stick cookware, water-repellent fabrics, food packaging, and firefighting foams, though growing regulatory and health concerns over their persistence, bioaccumulation, and toxicity are driving shifts in both supply and demand.

The global Perfluorinated Alkyl Acid market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
