## Abstracts

Perfluoromethyl vinyl ether (PMVE) is a fluorinated monomer primarily used as a copolymer in the production of specialty fluoropolymers and fluoroelastomers, characterized by its perfluorinated methyl group attached to a vinyl ether moiety, which imparts enhanced chemical resistance, thermal stability, and low-temperature flexibility to the resulting polymers. It is a key component in high-performance materials such as perfluoroelastomers (FFKM) and certain modified polytetrafluoroethylene (PTFE) grades, which are critical in demanding applications across industries including aerospace, semiconductor manufacturing, automotive, and chemical processing, where extreme conditions?such as exposure to aggressive chemicals, high temperatures, or stringent purity requirements?necessitate materials with superior inertness and durability.

The global Perfluoromethyl Vinyl Ether market size was estimated at USD 150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
