Abstracts

Perfluoropolyethers (PFPEs) are long-chain polymers composed of three elements: carbon, oxygen and fluorine, with a unique chemical structure and excellent physicochemical properties. Its molecule mainly contains C-F bond, which gives PFPE very high chemical inertness, thermal oxidative stability, flame retardancy and radiation resistance. The anionic catalytic polymerization method using hexafluoropropylene oxide as raw material is one of the more researched methods, which makes the product polymerization degree different due to the different catalyst systems and reaction conditions. These researches not only promote the optimization of the performance of PFPE materials, but also provide theoretical basis and technical support to further enhance their environmental stability and recyclability.

The global Perfluoropolyether(PFPE) Fluorinert Electronic Liquids market size was estimated at USD 635.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
