Abstracts

Pericardial bioprosthesis is a type of heart valve replacement device derived from bovine or porcine pericardial tissue that is chemically treated and mounted on a supportive frame, designed to replace dysfunctional native heart valves in patients suffering from conditions such as aortic stenosis or regurgitation; these bioprosthetic valves are distinguished by their favorable hemodynamic performance, reduced risk of thromboembolism compared to mechanical valves, and avoidance of lifelong anticoagulation therapy, making them particularly suitable for older patients, those with contraindications to blood thinners, or individuals seeking a balance between durability and quality of life.

The global Pericardial Bioprosthesis market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
