Abstracts

Periodontal care scalers are specialized dental instruments designed for the removal of calculus (tartar), plaque, and biofilm from tooth surfaces, particularly below the gumline and within periodontal pockets, to prevent and treat gum diseases such as gingivitis and periodontitis. These devices include both manual scalers, such as curettes and sickle scalers, which rely on the skill of the dental professional for precise debridement, and powered ultrasonic or sonic scalers, which use high-frequency vibrations to break down deposits more efficiently while often incorporating water irrigation for cooling and flushing away debris. The design and functionality of these instruments are critical to effective periodontal therapy, emphasizing ergonomics, material durability (typically stainless steel or titanium), and the ability to access subgingival areas without causing undue trauma to soft tissues or tooth structure.

The global Periodontal Care Scalers market size was estimated at USD 685.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
