## Abstracts

Bone density or bone mineral density (BMD) is the amount of bone mineral in bone tissue. Bone density measurement is used in clinical medicine as an indirect indicator of osteoporosis and fracture risk. Bone densitometers are known to offer improved diagnostic sensitivity in cases of osteoporotic fractures, playing a vital role in diagnosis of fracture before it could occur. It is measured by a procedure called densitometry, often performed in the radiology or nuclear medicine departments of hospitals or clinics. The measurement is painless and non-invasive and involves low radiation exposure. A key driver in the axial bone densitometry measurement market is the growing aging population worldwide. As the elderly population increases, so does the prevalence of bone-related diseases such as osteoporosis. This demographic shift fuels the demand for axial bone densitometry measurements, which are essential for diagnosing bone density issues and assessing fracture risk. However, a significant challenge in this market is the cost of equipment and accessibility to these diagnostic services. High upfront costs for densitometry machines and limited access in certain regions hinder widespread adoption, making it crucial for stakeholders to address affordability and equitable distribution to ensure effective bone health management, particularly in underserved areas.

The global Peripheral Bone Densitometry market size was estimated at USD 316.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
