Abstracts

Peripheral Drug Eluting Stent is a kind of medical device used to treat peripheral vascular stenosis or occlusive disease. It consists of a stent, usually made of metal, and a drug coating. The stent is inserted by balloon expansion or self-expansion to support narrow or blocked blood vessels and keep blood flow open. The drug coating is coated on the surface of the stent and contains drugs that inhibit the proliferation of vascular smooth muscle cells, such as paclitaxel or sirolimus, etc., which can be released slowly after stent implantation, reducing the risk of restenosis and thrombosis in the stent, and improving the long-term patency rate of blood vessels.

The global Peripheral Drug Eluting Stent market size was estimated at USD 5710.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
