Report Overview

The Peripheral Intravascular Ultrasound (IVUS) Catheter is a minimally invasive medical device used to visualize and assess blood vessels from within, primarily for diagnosing and treating peripheral vascular diseases such as atherosclerosis, stenosis, or aneurysms. It employs high-frequency ultrasound technology mounted on a catheter tip to generate real-time, high-resolution cross-sectional images of vessel walls, plaque composition, and blood flow dynamics, enabling clinicians to make precise treatment decisions. Unlike traditional angiography, IVUS provides detailed intravascular imaging, improving procedural accuracy in stent placement, lesion assessment, and post-interventional monitoring. These catheters are typically used in interventional radiology and cardiology settings, with applications expanding due to advancements in imaging resolution, catheter flexibility, and integration with other intravascular modalities like optical coherence tomography (OCT). The market is driven by rising peripheral artery disease (PAD) prevalence, increasing demand for precise diagnostic tools, and the shift toward minimally invasive procedures, though cost constraints and reimbursement challenges may limit broader adoption in certain regions.

The global Peripheral Intravascular Ultrasound IVUS Catheter market size was estimated at USD 252.02 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 17.17% during the forecast period.
