### Report Overview:

Intravascular ultrasound (IVUS) is also known as endovascular ultrasound or intravascular echocardiography. It uses a transducer or probe to generate sound waves and produce pictures of the insides of blood vessels. IVUS uses a special catheter with a small ultrasonic transducer on one end. The doctor threads the catheter through an artery or vein to the target location. Once there, the transducer generates sound waves to produce images of the blood vessels and help assess various conditions. The IVUS catheter is a thin, flexible tube with a tiny ultrasonic transducer attached to one end. The other end of the catheter connects to a computer workstation that converts the sound waves from the transducer into real-time images on a monitor. Different size catheters are available depending on the type of blood vessel being imaged.

The Global Peripheral Intravascular Ultrasound (IVUS) Catheter Market Size was estimated at USD 180.21 million in 2023 and is projected to reach USD 462.27 million by 2029, exhibiting a CAGR of 17.00% during the forecast period.
