Report Overview

Intravascular ultrasound (IVUS) is also known as endovascular ultrasound or intravascular echocardiography. It uses a transducer or probe to generate sound waves and produce pictures of the insides of blood vessels. IVUS uses a special catheter with a small ultrasonic transducer on one end. The doctor threads the catheter through an artery or vein to the target location. Once there, the transducer generates sound waves to produce images of the blood vessels and help assess various conditions. The IVUS catheter is a thin, flexible tube with a tiny ultrasonic transducer attached to one end. The other end of the catheter connects to a computer workstation that converts the sound waves from the transducer into real-time images on a monitor. Different size catheters are available depending on the type of blood vessel being imaged.
