Abstracts

Permalloy for current sensors refers to a class of nickel-iron soft magnetic alloys, typically containing around 80% nickel and 20% iron, engineered to exhibit high magnetic permeability, low coercivity, near-zero magnetostriction, and minimal hysteresis loss, making them exceptionally responsive to low magnetic fields while maintaining stability across varying temperatures and frequencies. These properties allow permalloy cores to precisely concentrate and measure magnetic fields generated by electrical currents, enabling accurate non-contact current sensing in applications such as automotive systems, industrial motor drives, renewable energy inverters, and consumer electronics, where they form the essential sensing element in devices like current transformers, open-loop and closed-loop Hall-effect sensors, and fluxgate transducers.

The global Permalloy For Current Sensor market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
