## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Permeable Cryoprotectant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Osmotic cryoprotectants are a class of chemical substances with low molecular weight, high water solubility and membrane permeability. They can enter the cell through the cell membrane under low temperature conditions and reduce freezing damage through various mechanisms. Its core mechanisms of action include: 1) combining with water molecules in cells to form hydrogen bonds, reducing the proportion of freezable water in cells, thereby reducing ice crystal formation; 2) lowering the freezing point of the solution by increasing the concentration of solutes in cells, delaying the phase change process; 3) replacing bound water on the surface of biological macromolecules (such as proteins and lipid membranes) to maintain their natural conformation and functional integrity; 4) regulating intracellular osmotic pressure to alleviate cell shrinkage caused by freezing and dehydration. Typical representatives include glycerol, dimethyl sulfoxide (DMSO), ethylene glycol, etc., because they can directly act on key molecules in cells, they are irreplaceable in the preservation of biological samples such as germ cells, embryos and stem cells that are highly sensitive to freezing damage.

The global Permeable Cryoprotectant market size was estimated at USD 69.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
