Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Perovskite Oxides competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Perovskite oxides are a class of crystalline materials with the general chemical formula ABO_3 , where "A" and "B" are typically metal cations of different sizes and valences, and "O" represents oxygen. Their structure is derived from the mineral perovskite ($CaTiO_3$) and is characterized by a cubic or distorted cubic lattice where the larger A-site cations occupy the corners of the unit cell, B-site cations are at the center, and oxygen anions are positioned at the face centers. These materials exhibit a wide range of functional properties including ferroelectricity, superconductivity, magnetoresistance, and catalytic activity making them valuable in applications such as fuel cells, sensors, memory devices, and photovoltaics. The tunability of their physical and chemical behavior through substitution at the A or B sites is a key advantage in material design.

The global Perovskite Oxides market size was estimated at USD 1374.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
