Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Perovskite Solar Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Perovskite solar modules are complete solar cell modules made by using perovskite materials as the light-absorbing layer and integrating other cell component materials (such as electron transport layers, hole transport layers, and transparent conductive electrodes). Perovskite solar modules are a high-efficiency, low-cost solar cell system designed to convert solar photovoltaic energy into electrical energy. Perovskite materials are typically composed of metal halides (such as lead or tin) and halogens (such as chlorine, bromine, or iodine), and have good photoelectric properties. In 2024, global perovskite solar module production reached 2.15 gigawatt-hours, with an average selling price of \$0.29/W. Gross margin ranged from 29.8% to 33.74%. Production Capacity: Hubei Wandu Solar Energy Co., Ltd.'s 3GW perovskite photovoltaic module production project has officially settled in Fuyang. The company will simultaneously plan a 30GW perovskite module project, a 10,000-ton-per-year perovskite material production project, and a perovskite module equipment project. On November 14, 2025, the Zhongshan Municipal Bureau of Ecology and Environment accepted the application for a new project of 250MW perovskite crystalline silicon tandem solar cells and 350,000 sets of modules per year from Heijing Optoelectronics (Zhongshan) Co., Ltd. Liyuan New Energy has built an 8,000-square-meter 100MW perovskite solar cell R&D and production base, with a cumulative investment of over 100 million yuan. It plans to officially put 1.2m²0.6m perovskite solar cells into production in August 2025. Case Study: Quzhou High-speed Railway New City Phase II Rooftop Power Station. In Quzhou High-speed Railway New City Phase II, to echo the overall architectural design, light gray photovoltaic modules were laid on the rooftop,

balancing aesthetics and photovoltaic power generation. Installed Capacity: 444kW. Perovskite solar cells are solar cells that utilize perovskite-type organometal halide semiconductors as light-absorbing materials, belonging to the third generation of solar cells. Third-generation solar cells mainly refer to some new concept cells with high conversion efficiency, such as dye-sensitized cells, quantum dot cells, and organic solar cells, also known as new concept solar cells. Perovskite solar cells have a similar layered structure to traditional photovoltaic cells. They mainly consist of five layers: a transparent conductive substrate, an electron transport layer (ETL), a perovskite light-absorbing layer, a hole transport layer (HTL), and a metal electrode. Perovskite cells combine the advantages of first-generation crystalline silicon cells (stability, high efficiency, and low cost) with the advantages of second-generation inorganic thin-film cells (high theoretical efficiency and simple fabrication process). They achieve higher theoretical efficiency using low-cost raw materials, driving efficiency improvement and cost reduction in the photovoltaic industry, and opening up long-term market potential? a next-generation solar cell technology. Perovskite cells mainly include two technical routes: single-junction and tandem. The theoretical limit photoelectric conversion efficiencies of single-junction and tandem cells are 33% and 44%, respectively, with tandem cells exhibiting higher conversion efficiency compared to crystalline silicon cells. Perovskite tandem solar cells offer significant efficiency improvements and represent the next stage of development for crystalline silicon. As crystalline silicon module prices fall below 1 yuan/W, the cost-effectiveness logic of a single perovskite cell is becoming increasingly difficult to realize. Perovskite-crystalline silicon tandem solar cells are compatible with existing crystalline silicon production capacity and can be combined with existing HJT and TOPCon technologies. Upgrading products can be achieved simply by adding perovskite processing to existing production lines. The resulting tandem modules are expected to achieve efficiencies exceeding 30%, representing a generational difference compared to traditional crystalline silicon. Perovskite cell manufacturers, crystalline silicon manufacturers, and equipment manufacturers have reached a consensus on the tandem technology route, which is poised to become the industry mainstream.

The global Perovskite Solar Module market size was estimated at USD 624.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 40.60% during the forecast period.
