Abstracts

Perovskites are a class of materials that have a crystal structure similar to the mineral perovskite, which is composed of calcium titanate (CaTiO_3). The general formula of perovskites is ABX_3 , where A and B are cations of different sizes and X is an anion, usually oxygen. Perovskites have various properties, such as high dielectric constants, ferroelectricity, superconductivity, and photovoltaic effects, depending on the composition and arrangement of the atoms. Perovskites are used for various applications, such as solar cells, LEDs, lasers, sensors, and memory devices. Some of the future market trends of perovskites are: The increasing demand for renewable energy sources and energy-efficient devices, which will boost the demand for perovskite solar cells as a low-cost and high-performance alternative to conventional silicon solar cells. The growing adoption of nanotechnology and microelectronics, which will create opportunities for perovskite nanomaterials and microelectronic components with enhanced optical, electrical, and magnetic properties. The development of new synthesis methods and purification techniques, which will improve the quality and stability of perovskite materials and reduce the environmental impact of their production and disposal.

The global Perovskites market size was estimated at USD 92.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.70% during the forecast period.
