Abstracts

Peroxide crosslinking generally uses organic peroxide as a crosslinking agent. Under the action of heat, it decomposes to generate active free radicals. These free radicals generate active points on the polymer carbon chain and produce carbon-carbon crosslinks to form a network structure. This technology requires high-pressure extrusion equipment to allow the crosslinking reaction to proceed in the barrel, and then the product is heated by rapid heating to produce a crosslinked product.

The global Peroxide Cross-linked Polyethylene market size was estimated at USD 986.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
