Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Personal AI Robot competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Personal AI Robot production reached approximately 3.49 million units, with an average global market price of around US\$ 265 per unit. A personal AI robot is an intelligent assistant designed specifically for individual users. It can interact through natural language, learn user habits, and provide personalized services. Generally speaking, the core functions of a personal AI bot are as follows:

1. Intelligent Conversation: Leveraging natural language processing (NLP) technology, it enables chat, question-and-answer sessions, and emotional interaction.
2. Task Management: Scheduling schedules, setting reminders, and managing to-do lists.
3. Information Processing: Rapidly retrieving knowledge, summarizing documents, translating languages, and even analyzing data.
4. Personalized Learning: Recommending content (such as news, courses, and books) based on user interests.
5. Smart Home Control: Connecting with IoT devices to control lighting, temperature, and more.
6. Creative Assistance: Assisting with writing, generating images/music, and providing design inspiration.

Large language models empower robots with powerful natural language understanding and generation capabilities, enabling them to engage in fluent, logical conversations and comprehend complex commands. Robots can not only process text but also understand images (computer vision), hear speech (speech recognition), and even combine multiple pieces of information to make comprehensive judgments, which is crucial for interacting with their environment. Enabling robots to learn optimal action strategies through trial and error is particularly useful for motion control and complex task decision-making. Decreasing sensor costs and improving performance: Sensors such as lidar, depth cameras, and inertial measurement units (IMUs) are becoming

smaller, cheaper, and more accurate, providing robots with both "eyes" and "ears." More flexible, quieter, and more efficient motor and joint designs enable robots to move more like humans while consuming less energy.

The global Personal AI Robot market size was estimated at USD 925.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.60% during the forecast period.
