Abstracts

Personal Rapid Transit (PRT) is a miniaturized, on-demand transportation system based on automated guided tracks. It uses 2-6 seat carriages to provide point-to-point direct transportation. Vehicles are typically dispatched by a central control system and feature technologies such as driverless operation, multi-level transportation, and virtual multiple-unit operation. Its gross profit margin varies significantly depending on the company's positioning, ranging from 25% to 45%. Market drivers primarily include the following: Urbanization and tourism development are creating new demands: With a global urbanization rate exceeding 56%, the scale of urban green spaces, theme parks, and other public spaces continues to expand, leading to a surge in demand for efficient and flexible transportation solutions. For example, data from the China Urban Rail Transit Association shows that by the end of 2022, 308 subway lines were in operation in 55 cities in mainland China. However, traditional subways are expensive (600-1 billion RMB per kilometer) and slow (average 25-35 km/h), making them unsuitable for small-scale circulation needs. PRT systems, with their advantages of low cost, medium capacity, and high speed, have become the preferred solution for densifying urban transportation networks. Technological iteration is addressing traditional pain points: The new generation of PRT systems integrates technologies such as 5G, V2X, AI, and high-precision positioning to achieve centimeter-level navigation, real-time scheduling, and intelligent obstacle avoidance. For example, one project solved the problem of low reliability of traditional movable turnouts by using fixed turnouts and autonomous guiding bogie technology, supporting track changes every 0.1 seconds; the application of a magnetic levitation-like principle reduced vehicle running resistance by 90% and increased speed to 120 km/h, significantly shortening travel time. Technological breakthroughs reduce operating costs; according to a study by the EU's EDICT, PRT systems can achieve operational break-even through fare revenue, and even repay part of the investment. Policy support and environmental awareness drive industry

standardization: Many countries worldwide have introduced carbon neutrality policies, requiring public transportation to reduce emissions. For example, the UK government plans to deploy PRT in its public transport system to reduce road pollution; China's 14th Five-Year Plan explicitly supports green transportation development and encourages the exploration of new travel modes. At the same time, the growing public demand for "on-demand travel" and "zero congestion" is driving the extension of PRT from industrial parks to urban trunk networks. Policy dividends and increased technological maturity combine to create a powerful force.

The global Personal Rapid Transit (PRT) Technology market size was estimated at USD 162.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.60% during the forecast period.
