Abstracts

Personalized mRNA Cancer Vaccine Therapy is a vaccine designed for individual patients' tumor-specific antigens. This vaccine extracts tumor tissue samples from patients, analyzes the gene mutations and protein expressions within, and identifies the unique antigens of the tumor. Using mRNA technology, it then delivers the coding information of these antigens to the patient's immune cells, stimulating them to produce an immune response against these specific antigens. Since the vaccine is designed based on the individual tumor characteristics of the patient, it is highly personalized and targeted. Personalized mRNA Cancer Vaccines have shown potential in treating various types of cancer, offering new treatment options and potentially prolonging survival for patients.

The global Personalized mRNA Cancer Vaccine Therapy market size was estimated at USD 1347.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
