Report Overview

The market for pertussis treatment encompasses pharmaceutical products and therapies aimed at preventing, managing, and curing whooping cough, a highly contagious respiratory infection caused by *Bordetella pertussis*. The treatment landscape includes antibiotics such as macrolides (e.g., azithromycin, clarithromycin, erythromycin) for infection control, along with supportive care to alleviate symptoms like severe coughing fits, particularly in infants and high-risk populations. Vaccination remains the cornerstone of prevention, with widely used DTaP (diphtheria, tetanus, and acellular pertussis) and Tdap (tetanus, diphtheria, and pertussis) vaccines driving prophylactic demand. The market is influenced by regional immunization policies, disease resurgence in populations with waning immunity, and emerging antibiotic resistance, prompting research into novel therapeutics and booster vaccines. Geographically, developed regions with robust immunization programs exhibit lower incidence rates, while developing nations face challenges in vaccine accessibility and diagnostic delays, creating disparities in treatment demand. Increasing awareness, government immunization initiatives, and advancements in vaccine technology are key growth drivers, though high costs and logistical barriers in low-resource settings remain constraints.

The global Pertussis Treatment market size was estimated at USD 454.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
