Abstracts

Petroleum-based aviation fuels refer to fuels derived from petroleum, specifically designed for use in aircraft. These fuels mainly include jet fuel (Jet A, Jet A-1) and aviation gasoline (AVGAS). Petroleum-based aviation fuels play a crucial role in the aviation industry, being widely used in civil aviation, military aviation, and some specialized aircraft. Due to the high-performance demands of aircraft, petroleum-based fuels must possess high energy density, low-temperature tolerance, stability, and excellent combustion characteristics. Jet fuel is the most commonly used petroleum-based aviation fuel, especially in jet aircraft and turbine engine aircraft. Jet A and Jet A-1 are the two primary types of jet fuel, with the key difference being their low-temperature performance. Jet A-1 is designed to perform in colder environments and higher altitudes due to its lower freezing point. AVGAS, on the other hand, is primarily used in piston-engine aircraft, particularly in small general aviation aircraft and some military planes. The product range of petroleum-based aviation fuels extends beyond just conventional jet fuel and aviation gasoline, also encompassing related auxiliary products such as additives and fuel mixtures. These are used to enhance fuel performance, reduce pollutant emissions, and improve engine efficiency. As global attention shifts toward sustainability, petroleum-based aviation fuels are continuously evolving, with innovations including the blending of biofuels and synthetic fuels, aiming for more environmentally friendly and cost-effective aviation fuel solutions.

The global Petroleum-Based Aircraft Fuels market size was estimated at USD 201500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
