Report Overview

Petroleum naphtha is a light distillate hydrocarbon liquid derived from the refining of crude oil or natural gas processing, typically boiling in the range of 30°C to 200°C. It consists of a complex mixture of paraffins, naphthenes, and aromatics, with its composition varying based on the source and refining process. Naphtha is a critical intermediate feedstock in the petrochemical industry, primarily used for steam cracking to produce ethylene and other olefins, as well as in gasoline blending, solvents, and other industrial applications. Its properties, such as volatility and chemical composition, make it a versatile product in refining and chemical manufacturing. The market for petroleum naphtha is heavily influenced by crude oil prices, refining capacity, petrochemical demand, and regional supply-demand dynamics, with major consumption centers in Asia, North America, and Europe.
