## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PFC Control ICs competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PFC Control ICs are integrated circuits specifically designed to implement Power Factor Correction (PFC) in power conversion systems. Their primary role is to shape the input current waveform in phase with the input voltage, thus increasing power factor, reducing total harmonic distortion (THD), and improving overall energy efficiency in compliance with global power quality standards such as IEC 61000-3-2. Typically deployed at the front-end of AC-DC converters, PFC control ICs are widely used in high-power applications such as servers, industrial automation, EV chargers, LED lighting, telecom base stations, and household appliances. Modern chips support Boost or Totem-Pole topologies and integrate protections such as OVP, OCP, UVLO, soft-start, and thermal shutdown, making them essential for high-performance power supply systems. In 2024, the average unit price of PFC Control ICs was \$4, and the production volume was 275 million units.

The global PFC Control ICs market size was estimated at USD 1100.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global PFC Control ICs market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
