In cataract surgery, there is an ever present need to preserve the delicate structures of the eye while removing an opaque lens. The most modern method is phacoemulsification, whereby the lens is emulsified with ultrasound before being suctioned out. Phacoemulsification systems provide a platform for performing cataract surgery, as well as anterior vitrectomy. For a phacoemulsification system, one of the most important features will be the suction/vacuum component. Pumping systems are usually peristaltic or Venturi (aspirating). Some phaco and vitrectomy systems have dedicated microprocessors to measure in-line vacuum pressure.

The global Phacoemulsification Systems market size was estimated at USD 247.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.00% during the forecast period.
