Abstracts

Phage display is a technique that allows the selection of antibodies, or antibody fragments, with a specific binding affinity for a target antigen. Bacteriophages (viruses that infect bacteria) are engineered to display a library of antibody fragments on their surface then mixed with an immobilized target antigen. The phages that bind to the antigen are isolated and amplified. The process is repeated multiple times to isolate the phage that displays the highest binding affinity to the target antigen. Once the phage with the desired antibody fragment is identified, the DNA sequence encoding the fragment can be extracted and used to produce large quantities. The antibody fragments are derived from a library of light and heavy chains with minor or major alterations that are hypothesized to impact binding efficiency and/or specificity. Phage display is a versatile and powerful method for generating antibodies with high specificity, affinity and functionality.

The global Phage Display-based Antibody Discovery Platform market size was estimated at USD 892.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
