Abstracts

The process by which data relationships are built between unique identifiers of saleable units, the cartons into which they are packed, and the next level of packaging, cases and pallets is known as aggregation. The data is then used by supply chain partners to "infer" that the correct goods and quantity are enclosed within the respective carton, case or pallet without having to open each and conduct an inspection. Aggregation is the process in which every participant along the pharmaceutical supply chain receives information from its predecessor and then supplements this with its own data. Data aggregates are stored in a database and then passed along to the next partner along the pharmaceutical supply chain. The data can be requested at any time and includes aggregation data of the primary, secondary and tertiary packaging. Across the World, Serialization Is Being Adopted. By 2020, it has been estimated that nearly 90 percent of prescription drugs globally will be serialized. Although neither the U.S. DSCSA nor the EU FMD requires the capture or use of aggregation data, in order to streamline pharma operations, aggregation is necessary. Aggregation enables all companies along the pharma supply chain to build a serialized relationship between unique identifiers that are assigned to packaging containers, facilitating requirements in the U.S. FDA regulation DSCSA and the EU Falsified Medicines Directive (FMD). Aggregation creates the serialized package hierarchy data to support inference, essential to facilitating the authenticity of medications relatively easily. Pharmaceutical companies use aggregation to collect and analyze multiple parameters for medications produced on their premises.

The global Pharmaceutical Aggregation Solution market size was estimated at USD 236.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
