Abstracts

Dicalcium phosphate dihydrate (chemical formula: $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$) is a calcium phosphate compound containing hydrated molecules, commonly known as calcium hydrogen phosphate dihydrate. It is an important derivative of calcium phosphate, widely used in biomedical, agricultural, and industrial fields. In the pharmaceutical industry, dicalcium phosphate dihydrate is often used as a filler for tablets and capsules, which helps in the formation of drugs. Compared to some other fillers, it has better fluidity and compressibility, which can help drugs form better during the compression process and ensure the quality of tablets. Calcium hydrogen phosphate tablets can supplement the calcium element needed by the human body, mainly used to treat symptoms such as fatigue and osteoporosis caused by calcium deficiency. In severe cases, they can even have therapeutic effects on conditions such as rickets and fractures. The applicable population mainly includes pregnant women, lactating women, and children, but it needs to be used under the guidance of a doctor.

The global Pharmaceutical Grade Dicalcium Phosphate Dihydrate market size was estimated at USD 125.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
