Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Pharmaceutical Grade Hypromellose Phthalate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Pharmaceutical Grade Hypromellose Phthalate is a high-performance enteric-coated pharmaceutical excipient commonly used as a coating material for tablets, granules, and capsules. It prevents dissolution in the acidic environment of the stomach but allows rapid dissolution in the upper small intestine. It is prepared by esterification of hydroxypropyl methylcellulose (HPMC) with phthalic anhydride, exhibiting excellent film-forming properties and stability. The upstream core raw materials include refined cellulose (usually wood pulp or cotton linter) as the backbone, chloromethane and propylene oxide for etherification, and phthalic anhydride as the key raw material for esterification. Global sales in 2024 were approximately 1,220 tons, with an average market price of about US\$45 per kilogram. The size of a single production line varies depending on the production process and investment scale. Industry gross profit margins range from 20% to 35%.

The global Pharmaceutical Grade Hypromellose Phthalate market size was estimated at USD 54.69 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
