Report Overview

Polyacrylic resin auxiliary materials are cationic or anionic copolymers obtained by polymerizing methacrylic acid and its esters in different proportions. They can be divided into different models according to their composition, proportion and degree of polymerization. Polyacrylic resins are collectively referred to as Eudragit abroad. There are Eudragit E, L, S, RL, RS, NE and Eastacry I and Kollicoat types. There are 4 forms of powder, granules, aqueous dispersion and organic solution ; In China, polyacrylic resins mainly include ?, ?, ? and other types. Due to their different properties, they have different applications in the production of preparations, of which polyacrylic resin ? is the most widely used in the production of preparations. Polyacrylic resin ? is made by copolymerizing anionic methacrylic acid and methyl methacrylate. The molar ratio of free carboxyl group to ester is about 1: 1; it is easily soluble in neutral and weakly alkaline environment and soluble in alcohol , But insoluble in water and ether, will swell in acetone, can form salts with alkali; can be used as a coating material that is insoluble in the stomach and soluble in the intestine, is an enteric resin, and can also be used mainly as an enteric Coating material.
