Abstracts

The basic principle of the pharmaceutical vacuum pump is that the circular motion of the motor causes the diaphragm in the pump to reciprocate through a mechanical device, thereby compressing and stretching the fixed volume of air in the pump chamber to form a vacuum, and generating a pressure difference between the pump suction port and the external atmospheric pressure. Under the action of the pressure difference, the gas is pressed into the pump chamber and then discharged from the exhaust port.

The global Pharmaceutical Vacuum Pump market size was estimated at USD 984.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
