## Abstracts

Pharmacokinetics Software is a type of professional software developed based on pharmacokinetic theory and computer algorithms. It is specifically used to process data related to the absorption, distribution, metabolism and excretion of drugs in organisms, and to realize functions such as parameter calculation, model building and process simulation. It provides data support and decision-making basis for drug development, clinical trials and personalized medicine. North America still dominates the global market, but the Asia-Pacific market is emerging at a faster growth rate. In 2023, North America was the largest revenue market in the field of pharmacokinetic computational biology, and in the life sciences software market, North America accounted for 42% of the market share in 2024, thanks to its mature innovative drug development system and the strong demand from numerous CRO companies. Policy adjustments by global regulatory agencies are continuously reshaping the development direction of pharmacokinetic software. The FDA's updated guidance in 2023 explicitly requires innovative drug applications to include physiologically based pharmacokinetic (PBPK) model data, and the EMA plans to implement an electronic submission system for ePK files by 2026. These policies are compelling pharmaceutical companies to adopt software with stronger compliance and better data management capabilities.

The global Pharmacokinetics Software market size was estimated at USD 476.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
