Report Overview:

A phase change coolant is a special substance that absorbs or releases heat through a phase change process and is used to control temperature or achieve cooling effects. In packaging, phase change coolants are often used to keep the temperature of products stable, especially during shipping. Phase change coolants usually use the principle of solid-liquid phase change or liquid-gas phase change to achieve temperature regulation. Specifically, when the temperature exceeds the phase transition temperature of the coolant, the coolant absorbs heat from the surrounding environment to keep the temperature stable. When the temperature drops, the coolant releases the stored heat to keep the temperature in balance. In packaging, phase change coolants are usually in solid or liquid form and can be embedded in the packaging material or placed individually inside the packaging. When the product needs cooling, the phase change coolant absorbs heat, preventing the product from overheating. When the product needs to be kept warm, the phase change coolant releases the stored heat, preventing the product from getting too cold.

The Global Phase Change Coolant for Packaging Market Size was estimated at USD 446.77 million in 2023 and is projected to reach USD 950.09 million by 2029, exhibiting a CAGR of 13.40% during the forecast period.
